

## Guidelines for Applying Licenses to Your Software

You can quickly and easily add a software license in MSD-LIVE by selecting options from a dropdown menu when you go to upload your datasets. This is an optional field, but we strongly encourage that you assign a license to protect you and your software and make sure you get credit for your work. To assist you in deciding what license you should apply to your software, please see the options below. This content is not legal advice but intended to provide general guidance. Some of these licenses, especially the permissive licenses, appear similar and can be used almost interchangeably. However, they have some minor differences that may matter to you as a researcher, so be sure to read the license text for specifics on each license.

### *Best practices when selecting a license*

- Select a commonly used license to ensure the maximum re-usability of your work
- Defer to funder or institution specific requirements about software licenses if they apply to your work
- If they have no preference, consider a public domain dedication
- To make re-use as likely as possible when you have options, choose a license which makes software available to the widest audience possible and allows the widest range of uses

### *Copyleft License*

- GNU GPL: This license ensures that all future improvements to the software it licenses will be free. The permission to use, copy, alter, and distribute is granted to everyone who holds a copy of the program. A work licensed with GPL remains GPL licensed even if the work was altered. Additionally, combining a GPL licensed work with a work subject to a different license leads to the work falling entirely under the GPL. This license puts more restrictions on downstream users.

### *Permissive Licenses*

- Apache 2.0: This license allows users to use the software for any purpose, to distribute it, to modify it, and to distribute modified versions of the software under the terms of the license. Unlike a "copyleft" license, Apache does not require a derivative work or modifications to the original to be distributed under the same license.
- Modified BSD: BSD, or Berkeley Software Distribution, refers to a family of licenses—the most common is the 2-clause BSD. This license does not put requirements on redistribution and it does not require a derivative work or modifications to the original to be distributed under the same license.
- MIT License: A very permissive license, requiring only the preservation of the copyright and license notices on derivatives. Licensed works, modifications, and larger works may be distributed under different terms and without source code.

### *Public Domain Dedication*

- CC0: This license is a Creative Commons license and is suitable for dedicating copyright for software to the public domain. The CC0 license places the associated work in the Public Domain. This means that the author has waived all rights to the work and others can use, modify, or distribute the work as they like without sharing source code or the licensing information. Users can also change the license on derivative software products. This license is great at making software available to the widest audience possible and allows the widest range of uses.
